

# Release Date

The Documoto 2016.7 Release will be available in October 2016.

# What's New

This release introduces key changes to assemblies, allows RFQs to be processed via an HTML5 form and fixed issues with the updated time stamp on media.

# Highlights

- PO/RFQ upgrade
  - You can now set up a quote template to use the HTML5 order management screen
    - Manage statuses using custom status values
    - Track the quote using an ID from ERP or from Documoto
    - Sort your order list by type (order or quote)
  - Admin changes
    - Turn on HTML or Flex order and quote forms
    - ERP headers can be used on the order form so those values get passed from order management to ERP
- Assemblies Upgrade
  - The existing assemblies logic has been completely bypassed and replaced with a simple indentation scheme.
    - Pages with assemblies (indented BOMs) will now always publish exactly how they look in Docustudio.
    - Pages with assemblies (indented BOMs) will only affect the page being published - no side effects on other pages.
    - The Docustudio feature to create indents remains unchanged visually.
    - A data migration will be performed to migrate all existing assemblies to the new indentation scheme.
    - The indentation display works in both Flex and HTML5 page viewers.
  - The Documoto processing instruction “Replace Assemblies” option has been removed.
  - Documoto publishing ignores the “Replace Assemblies” processing instruction.
- Bug fixes and enhancements
  - The focus was on improving how we timestamp media to improve exporting capabilities
  - Also fixed a few other bugs, noted in the list below

# Defect Fixes and Enhancements

Type	Summary	Comments
Defect	Create Assembly feature is incompletely updating books	Hotpoint links are added to items on a second page - previously this was not happening
Defect	Publisher Admin disconnected. Access Denied Error	We no longer fix sessions to IP for authentication or session timeout. This resolves an issue where some users would be timed out when their proxy service dynamically switched IPs in the middle of their session.
Enhancement	Add Language Data Support for the Listed Languages	We support translations for Hungarian, Finnish, Romanian, Norwegian, Turkish, Serbian, Ukranian. NOTE: We do not translate the UI, but allow our customers to input translations for these languages
Epic	Improve content and media updated date logic	Many changes were made to ensure accurate content and media updated dates. These were sweeping across media, pages, parts, and assemblies
Defect	Black screen on library search	Fixed. The screen now loads properly
